pIMZ is a framework for Imaging Mass Spectrometry (IMS) data analysis. The python implementation is available from github.com/mjoppich/pIMZ. For installation follow the instructions given in the GitHub repository.

pIMZ focuses on a differential setting, where masses, specific to certain areas are first determined, and then serve as input for a cell-type detection framework and/or a differential expression setting.

THE PIMZ FRAMEWORK: INSTALLATION AND USAGE

This section will tell you how to [install](#) pIMZ, but also refer you to some examples on [how to use](#) pIMZ.

1.1 Installation

The easiest way to install most Python packages is via pip.

If not already done, you must first install the following dependencies manually. This is because at the time of writing this document, dabest requires pandas $\sim=0.25$, which is incompatible with probably the rest of the world nowadays. So first dabest is installed, then numpy and pandas are upgraded again

```
sudo pip3 install dabest
sudo pip3 install numpy pandas --upgrade
```

Only then we should install pIMZ

```
sudo pip3 install pIMZ
```

pIMZ is now ready to go!

1.2 Usage

pIMZ can be used with several use-cases. Here two of these are highlighted.

1. Using a local imzML-file as source
2. Using public HuBMap-Data

1.2.1 Local imzML-file

The usage of pIMZ on a local imzML is shown in the examples. The [IMZMLprocess notebook](#) showcases how to use pIMZ to retrieve the correct data, normalize intensities, cluster spectra, determine background, perform differential analysis and finally combine multiple region for further comparative analyses.

1.2.2 Public HuBMap-Data

The HuBMap-Data example is divided into two notebooks. The first notebook describes the use of the [HuBMap-downloader](#). Since HuBMap-files are stored on Globus, specific care to access their API has to be taken. In order to download files yourself, you have to run [Globus Connect Personal](#) on the machine where you want to download the data to.

The usage of pIMZ on a public HuBMap-generated tissue is shown in the examples. The [HuBMAP_kidney](#) notebook showcases how to use pIMZ to retrieve the correct data, normalize intensities, cluster spectra, determine background, perform differential analysis and finally combine multiple region for further comparative analyses. In general, the workflow is no different than for any other local data.

PIMZ MODULES

2.1 imzML Parser

a imzML

2.2 SpectraRegion

a SpectraRegion

2.3 Clustering Module

a Clustering

2.4 Comparative

a Comparative

2.5 HuBMap Downloader

a downloader

class pIMZ.hubmap_downloader.HuBMAPDownloader

The HuBMAPDownloader let's the user download whole experiment folders from the public HuBMAP release on globus.

A globus account is required to sign in.

The user has to enter an endpoint to where the data is transferred. On a local machine, this most probably required globus connect personal.

cancel_transfer(*transferID*)

Cancels the data transfer with transferID

Parameters **transferID (str)** – Transfer ID to cancel.

create_timestamp(*deltaH=2*)

Creates an ISO 8601 timestamp to set a deadline for globus

Parameters **deltaH** (*int, optional*) – The timestamp is calculated as now+deltaH (in hours).. Defaults to 2.

Returns UTC timestamp in ISO8601 format

Return type str

get_local_endpoint()

Fetches the local endpoint. Returns None if no local endpoint is available.

Ensure that your globus connect personal is running!

Returns local endpoint id

Return type str

list_my_endpoints()

Lists all user endpoints

transfer_experiment(*experiment_data_id, local_path, label=None, local_endpoint_id=None, give_hours=2*)

Transfers an experiment from HuBMAP to the local_endpoint_id in the path local_path

Parameters

- **experiment_data_id** (*str*) – Experiment ID as given by HuBMAP (this usually is the global folder name)
- **local_path** (*str*) – Path in local endpoint where to store data
- **label** (*str, optional*) – Name of the data transfer. Defaults to experiment_data_id.
- **local_endpoint_id** (*str, optional*) – Target endpoint id. Defaults to None.
- **give_hours** (*int, optional*) – Timelimit for transfer. This will set the deadline in the datatransfer. Defaults to 2.

Returns transfer id of started transfer

Return type [str]

transfer_states()

Lists all transfer states of transfers started via this interface (also completed ones).

CHAPTER
THREE

IMZMLPROCESS

```
%load_ext autoreload
import os,sys
import pandas as pd
import seaborn as sns
import numpy as np
import progressbar
import dill as pickle
from datetime import datetime
import matplotlib as mpl
import matplotlib.pyplot as plt
import logging

sys.path = [".."] + sys.path

print(sys.path)

%autoreload 2
from pIMZ.regions import SpectraRegion, ProteinWeights
%autoreload 2
from pIMZ.imzml import IMZMLExtract
%autoreload 2
from pIMZ.comparative import CombinedSpectra

import pIMZ

print(pIMZ.__file__)
```

The autoreload extension is already loaded. To reload it, use:

```
%reload_ext autoreload
['..', '/mnt/f/dev/git/pyIMS/examples', '/usr/lib/python38.zip', '/usr/lib/python3.8',
 ↵ '/usr/lib/python3.8/lib-dynload', '', '/home/mjoppich/.local/lib/python3.8/site-
-packages', '/home/mjoppich/.local/lib/python3.8/site-packages/pIMZ-1.0-py3.8-linux-x86_
-64.egg', '/home/mjoppich/.local/lib/python3.8/site-packages/progressbar-2.5-py3.8.egg',
 ↵ '/usr/lib/python3/dist-packages', '/usr/local/lib/python3.8/dist-packages', '/usr/
-local/lib/python3.8/dist-packages/mpld3-0.3.1.dev1-py3.8.egg', '/usr/local/lib/python3.
-8/dist-packages/IPython/extensions', '/home/mjoppich/.ipython', '..']
../pIMZ/__init__.py
```

Load an imzML file

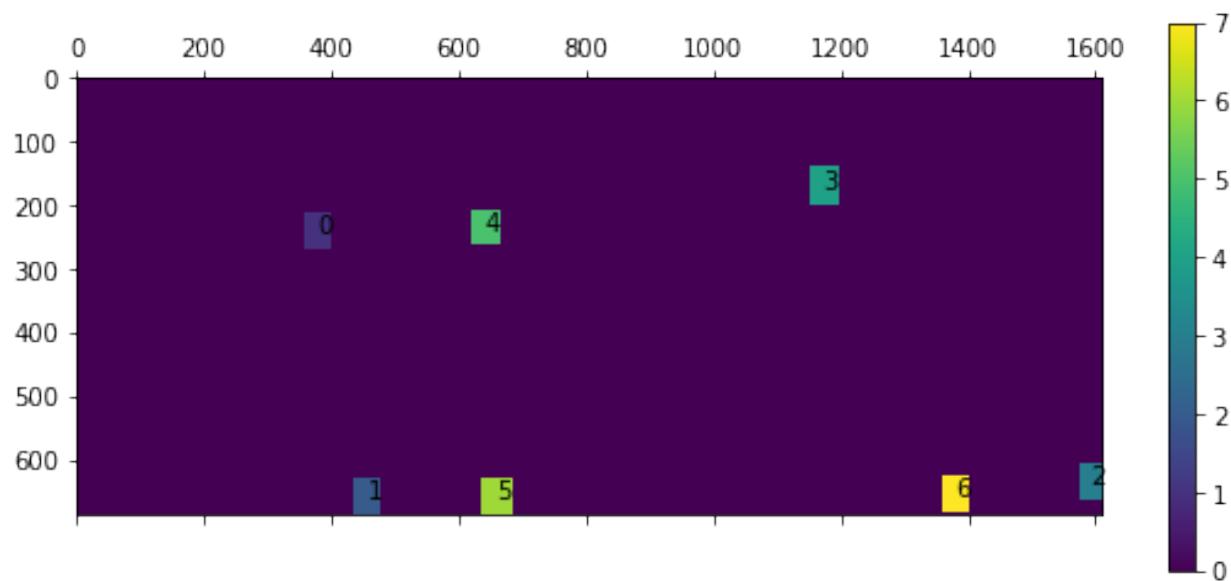

```
imze = IMZMLExtract("/mnt/d/dev/data/msi/slides/181114_AT1_Slide_D_Proteins.imzML")
```

```
Opening regions file for /mnt/d/dev/data/msi/slides/181114_AT1_Slide_D_Proteins.imzML
0 356 400 215 273
1 436 478 632 687
2 1572 1612 608 666
3 1149 1197 142 205
4 618 666 211 266
5 633 684 630 688
6 1357 1400 628 686
```

Explore which regions are there?

```
imze.list_regions()
```

```
0 ((356, 400, 215, 273), 2655)
1 ((436, 478, 632, 687), 2408)
2 ((1572, 1612, 608, 666), 2419)
3 ((1149, 1197, 142, 205), 3136)
4 ((618, 666, 211, 266), 2744)
5 ((633, 684, 630, 688), 3068)
6 ((1357, 1400, 628, 686), 2596)
```

```
{0: ((356, 400, 215, 273), 2655),
1: ((436, 478, 632, 687), 2408),
2: ((1572, 1612, 608, 666), 2419),
3: ((1149, 1197, 142, 205), 3136),
4: ((618, 666, 211, 266), 2744),
5: ((633, 684, 630, 688), 3068),
6: ((1357, 1400, 628, 686), 2596)}
```

Start with processing the first region , region 0

```
spectra0_orig = imze.get_region_array(0, makeNullLine=True)
spectra0_intra = imze.normalize_region_array(spectra0_orig, normalize="intra_median")
spectra0 = imze.normalize_region_array(spectra0_intra, normalize="inter_median")
```

```
spectra1_orig = imze.get_region_array(1, makeNullLine=True)
spectra1_intra = imze.normalize_region_array(spectra1_orig, normalize="intra_median")
spectra1 = imze.normalize_region_array(spectra1_intra, normalize="inter_median")
```

```
imze.plot_fcs(spectra0_orig, [(5,30),(10,30),(20,30),(25,30),(35,30),(40,30)])
```

```
imze.plot_fcs(spectra0_intra, [(5,30),(10,30),(20,30),(25,30),(35,30),(40,30)])
```

```
imze.plot_fcs(spectra0, [(5,30),(10,30),(20,30),(25,30),(35,30),(40,30)])
```

```
imze.plot_fcs(spectra1_orig, [(5,30),(10,30),(20,30),(25,30),(35,30),(40,30)])
```

```
imze.plot_fcs(spectra1_intra, [(5,30),(10,30),(20,30),(25,30),(35,30),(40,30)])
```

```
imze.plot_fcs(spectra1, [(5,30),(10,30),(20,30),(25,30),(35,30),(40,30)])
```

We can now ensure that the normalized spectra are indeed comparable.

Where are the highest peaks? This may give a hint on whether or not a normalization by max intensity would also have worked. => here: most probably yes!

```
imze.list_highest_peaks(spectra0, counter=True)
```

Let's plot the norm of each spectrum

```
imze.plot_tnc(spectra0)
```

It can be seen that the norm of the spectra differs. However, given that intensities should be comparable, and that there was sample everywhere => just continue

```
spec = SpectraRegion(spectra0, imze.mzValues)
```

```
spec.calculate_similarity(mode="spectra_log")
```

There are various (unsupervised) clustering techniques. Like UMAP+HDBSCAN

```
spec.segment(method="UMAP_DBSCAN", number_of_regions=15, min_cluster_size=9, num_samples=1000)
```

```
spec.redo_hdbscan_on_dimred(number_of_regions=15, min_cluster_size=9, num_samples=500)
```

```
len(spec.dimred_labels)
```

```
mpl.rcParams['figure.figsize'] = (10,6)
spec.vis_umap(legend=True)
mpl.rcParams['figure.figsize'] = (6,4)
```

```
spec.plot_segments()
```

```
spec.filter_clusters(method='remove_singleton')
spec.filter_clusters(method='merge_background')
spec.filter_clusters(method='remove_islands')
```

```
spec.plot_segments()
```

Which may or may not work well - more robustly, and maybe faster is a classic clustering of the similarity scores:

```
spec.segment(method="WARD", number_of_regions=15)
```

```
spec.plot_segments()
```

```
spec.filter_clusters(method='remove_singleton')
spec.filter_clusters(method='merge_background')
spec.filter_clusters(method='remove_islands')
```

```
spec.plot_segments()
```

A manual curation of the segmentation is still possible!

```
spec.segmented[0:6,] = 0
```

```
spec.plot_segments()
```

Consensus Analysis

```
spec.consensus_spectra()
```

```
spec.consensus_similarity()
```

```
spec.plot_consensus_similarity()
```

```
spec.plot_consensus_similarity(mode="spectra")
```

All clusters have a 95% similarity in median. Cluster 0 (background) is the most heterogeneous one.

```
#spec.plot_inter_consensus_similarity()
```

CHAPTER
FOUR

DIFFERENTIAL ANALYSIS

One of the stand-alone features of pyIMS is the integration with differential expression analysis. Here several key-features are presented.

First, single masses are looked at:

```
spec.mass_heatmap(14954, min_cut_off=0.0025)
```

The mass with m/z-value 14954 apparently is most active within the aorta structure (center of the image). Is this specific to a specific cluster

```
dfobj = spec.mass_dabest(14954)
```

The DABEST-Plot also clearly reveals that in contrast to the background, cluster 8 intensity values for this mass are quite higher than for all other clusters.

Obviously this mass is most intense in Cluster 8, but also cluster 14. We can now take a look at this mass by setting cluster 14 as reference cluster

```
spec.mass_dabest(14954, background=14)
```

Not knowing where this cluster 8 is, we can highlight it specifically:

```
spec.plot_segments(highlight=8)
```

Or together with cluster 14, where this mass is also prevalent.

On a sidenote: background is set to 0, other regions == 1, and the target region is set to 2

```
spec.plot_segments(highlight=[8, 11])
```

Just for the sake of clarity: we now remove all differential expression results!

```
spec.clear_de_results()
```

4.1 Protein m/z to name

For any combination of sequencing results with these IMS analyses, knowing which protein was measured is of interest.

Using a previously performed LC-MS/MS experiment, which delivers detected proteins together with the masses, allows an easy translation of m/z values to protein name. This work is done in the ProteinWeights object.

```
pw = ProteinWeights("protein_weights.tsv")
```

```

```

Marker masses/proteins/genes are genes which are differentially regulated when compared to the specific cluster and all other clusters (including or excluding the background cluster).

Making the distinction regarding the background cluster might be required if the target tissue is embedded in another tissue. Excluding the background might then deliver more sensitive results.

```
mgenes = spec.find_all_markers(pw, includeBackground=False,
                                replaceExisting=False,
                                outdirectory=". ./deresults/",
                                use_methods=["ttest", "rank"])
```

```
mgenes["ttest"]
```

```
mgenes_bg = spec.find_all_markers(pw, includeBackground=True, replaceExisting=False, use_
methods = ["ttest", "rank"])
```

After both find_all_markers runs we can list all DE results, which are then printed. Each row shows one contained DE results beginning with the test performed and then a tuple of two region/cluster IDs. In the first row here:

a t-test was performed on cluster 9 versus clusters 8,10,11,12,13,14,15 .

```
spec.list_de_results()
```

It's also easy to save the result to disk:

```
markerGenes = mgenes["ttest"]
markerGenes.to_csv("deresults/marker_genes.tsv", sep="\t", index=False)
```

```
markerGenesBG = mgenes_bg["ttest"]
markerGenesBG.to_csv("deresults/marker_genes_bg.tsv", sep="\t", index=False)
```

```
print("Number of unique, differentially detected proteins (from masses): {}".
format(len(set(mgenes["ttest"]["gene"]))))
```

```
print("Number of unique, differentially detected proteins (from masses): {}".
format(len(set(mgenes_bg["ttest"]["gene"]))))
```

In order to save the results, the SpectraRegion object can be pickled:

```
with open("slideD_region_0.spec.pickle", "wb") as fout:
    pickle.dump(spec, fout)
```

CELL-TYPE DETECTION

Cell-type detection requires analyseMarkers.py from https://github.com/mjoppich/scrnaseq_celltype_prediction.

One (obvious) question is: what can I do with those marker proteins? Well, a lot!

First, these are the proteins which you are interested in: these define your clusters, because they are present.

Second, these proteins give a clue about which cell types might be present, if cell-type specific genes were found.

Using the scrnaseq-celltype-prediction tool, this can be analysed! Let's download it first (requires wget, python3 and several other libraries - maybe). Did you know? This tool achieves better predictions than SingleR :)

Because we know what kind of sample we got (aorta embedded in liver), we can specify organs to specifically check for cell types. Organs to be considered are "Connective tissue" "Vasculature" "Heart" "Skeletal Muscle" "Smooth muscle" "Immune system" "Blood" "Epithelium" "Liver". This allows a context-specific evaluation!

```
! ls analyseMarkers.py
```

```
! wget https://raw.githubusercontent.com/mjoppich/scrnaseq_celltype_prediction/master/
  analyseMarkers.py
```

```
! python3 analyseMarkers.py --organs "Connective tissue" "Vasculature" "Heart" "Skeletal Muscle"
  "Smooth muscle" "Immune system" "Blood" "Epithelium" "Liver" --pvaladj qvalue -
  --markers deresults/marker_genes.tsv -n 2
```

This is quite interesting. For cluster 8 this tool predicts mainly monocytes or gamma delta t cells - cells which do not migrate into other tissues.

This makes sense, because one would expect these cell-types in the inner of the vessel.

H2AFX is known to be upregulated in lymphoblasts (check wikipedia ;)). Ifitm3 is highly expressed in both, Liver and Monocytes: <https://www.proteinatlas.org/ENSG00000142089-IFITM3/tissue> (Consensus dataset)

```
spec.plot_segments(highlight=(8))
```

```
! python3 analyseMarkers.py --organs "Connective tissue" "Vasculature" "Heart" "Skeletal Muscle"
  "Smooth muscle" "Immune system" "Blood" "Epithelium" "Liver" --pvaladj qvalue -
  --markers deresults/marker_genes_bg.tsv -n 2
```

In this analysis, the background was kept in. More differential genes are found, but also more liver-related cell types are found.

This suggests that the analysis which includes the liver background has influenced the found differential proteins too much.

Nonetheless, the results remain consistent. For cluster 8, the missing monocytes are replaced by hepatocytes, which are monocyte-like cells residing in the liver.

Cluster 9 showing high amounts of cardiomyocytes is also not unlikely, given its location at the outer area of the aorta.

```
spec.plot_segments(highlight=(9))
```

Finally the SpectraRegion can also be exported to Aorta3D.

```
#spec.to_aorta3d("./slided_test/", "slided", 0, protWeights=pw, nodf=False, pathPrefix=".  
↪ ./data/test_msi/")
```

```
!ls slided_test
```

PREPARATIONS FOR COMBINED SPECTRA - A COMPARATIVE ANALYSIS

```
spectra1 = imze.get_region_array(1, makeNullLine=True)
imze.normalize_region_array(spectra1, normalize="vector")
imze.list_highest_peaks(spectra1, counter=True)
print("Got spectra", spectra1.shape)

spec1 = SpectraRegion(spectra1, imze.mzValues)
spec1.calculate_similarity(mode="spectra_log_dist")
spec1.segment(method="WARD", number_of_regions=15)
spec1.plot_segments()
```

So far the results were only for one IMS sample.

Now the idea is to integrate multiple samples, in order to compare the different samples which were measured on the same slide.

Hence the remaining samples are processed, all in the same fashion. With the inter and intro normalization, the samples are made comparable.

```
pw = ProteinWeights("protein_weights.tsv")

def process_imzeregion(imze, regionID, basename):

    print("Processing regionID", regionID, "for basename", basename)

    spectra_orig = imze.get_region_array(regionID, makeNullLine=True)
    spectra_intra = imze.normalize_region_array(spectra_orig, normalize="intra_median")
    spectra = imze.normalize_region_array(spectra_intra, normalize="inter_median")

    rspec = SpectraRegion(spectra, imze.mzValues, name=basename + "_" + str(regionID))
    rspec.calculate_similarity(mode="spectra_log_dist")
    rspec.segment(method="WARD", number_of_regions=15)
    rspec.plot_segments()

    rspec.filter_clusters(method='remove_singleton')
    rspec.filter_clusters(method='merge_background')
    rspec.filter_clusters(method='remove_islands')
    rspec.filter_clusters(method='remove_islands', minIslandSize=15)
    rspec.plot_segments()

#rspec.consensus_spectra()
```

(continues on next page)

(continued from previous page)

```
#rspec.consensus_similarity()
#rspec.plot_consensus_similarity()

mgenes = None
mgenes_bg = None
mgenes = rspec.find_all_markers(pw, includeBackground=False, replaceExisting=False,
use_methods = ["ttest", "rank"])
mgenes_bg = rspec.find_all_markers(pw, includeBackground=True, replaceExisting=False,
use_methods = ["ttest", "rank"])

return rspec, mgenes, mgenes_bg
```

First set the logging level to warn, to remove too many messages ...

```
#loggers = [logging.getLogger(name) for name in logging.root.manager.loggerDict]
#for logger in loggers:
#    logger.setLevel(logging.WARN)
```

```
slided_0, slided0_mgenes, slided0_mgenes_bg = process_imzeregion(imze=imze, regionID= 0,
basename="slideD")
slided_1, slided1_mgenes, slided1_mgenes_bg = process_imzeregion(imze=imze, regionID= 1,
basename="slideD")

```

Here a CombinedSpectra is creates. This class allows to compare multiple SpectraRegions

```
combSpec = CombinedSpectra({0:滑动_0, 1:滑动_1, 4:滑动_4, 5:滑动_5})
```

The consensus_smilarity() function calculates the similarity between all the contained spectra's regions using the average cluster/region spectra.

```
combSpec.consensus_similarity()
```

```
combSpec.consensus_similarity_matrix
```

Since the inspection of this matrix becomes tedious, particularly if large, it can be plotted :)

```
combSpec.plot_consensus_similarity()
```

It can already be seen that some classes are more similar to each other, than others.

Now the single slide/region clusters are reclustered.

```
combSpec.cluster_consensus_spectra(number_of_clusters=10)
```

A detailed print out of the newly assigned cluster for each slide, region.

```
combSpec.region_cluster2cluster
```

The new assignment can also be plotted:

```
combSpec.plot_common_segments()
```

And of course, interpreted.

Slide 1 and Slide 5 appear to be similar, and slide 0 and slide 4.

```
combSpec.plot_common_segments(highlight=(4))
```

Similar to a normal SpectraRegion, also specific masses can be plotted. Here we can see that mass 14954 is not present in slides 1 and 5!

```
_ = combSpec.mass_heatmap(14954)
```

7.1 A first DE Analysis: Tunica Media

Slide 0 cluster 2 and slide 4 cluster 1 seem to be very similar. We now want to see whether some differences can be observed.

For this, we suspect that slides 0 and 4 are disease-samples, and slides 1 and 5 are controls.

We now compare the outer regions of both samples:

```
combSpec.regions["slided_0"].plot_segments(highlight=[8,9])
combSpec.regions["slided_1"].plot_segments(highlight=[12,14])
```

```
combSpec.get_internormed_regions()
```

```
print(np.median(combSpec.region_array_scaled["slided_1"]), np.median( combSpec.regions[ "slided_1"].region_array))
```

```
combSpec.mass_intensity(14954, regions=["slided_0", "slided_1"], scaled=False)
```

```
combSpec.mass_intensity(14954, regions=["slided_0", "slided_1"], scaled=True)
```

```
resdf, expr, pdata = combSpec.find_markers("slided_0", [8,9], "slided_1", [12,14], pw,_
scaled=True)
```

```
combSpec.list_de_results()
```

```
mydf = resdf["ttest"][(('slided_0', (8,9,)), 'slided_1', (12,14,))]
```

In order to plot a volcano plot for the differential masses/proteins, the result DF is subset to only have masses displayed that have a mean intensity of at least 2.

```
from adjustText import adjust_text
```

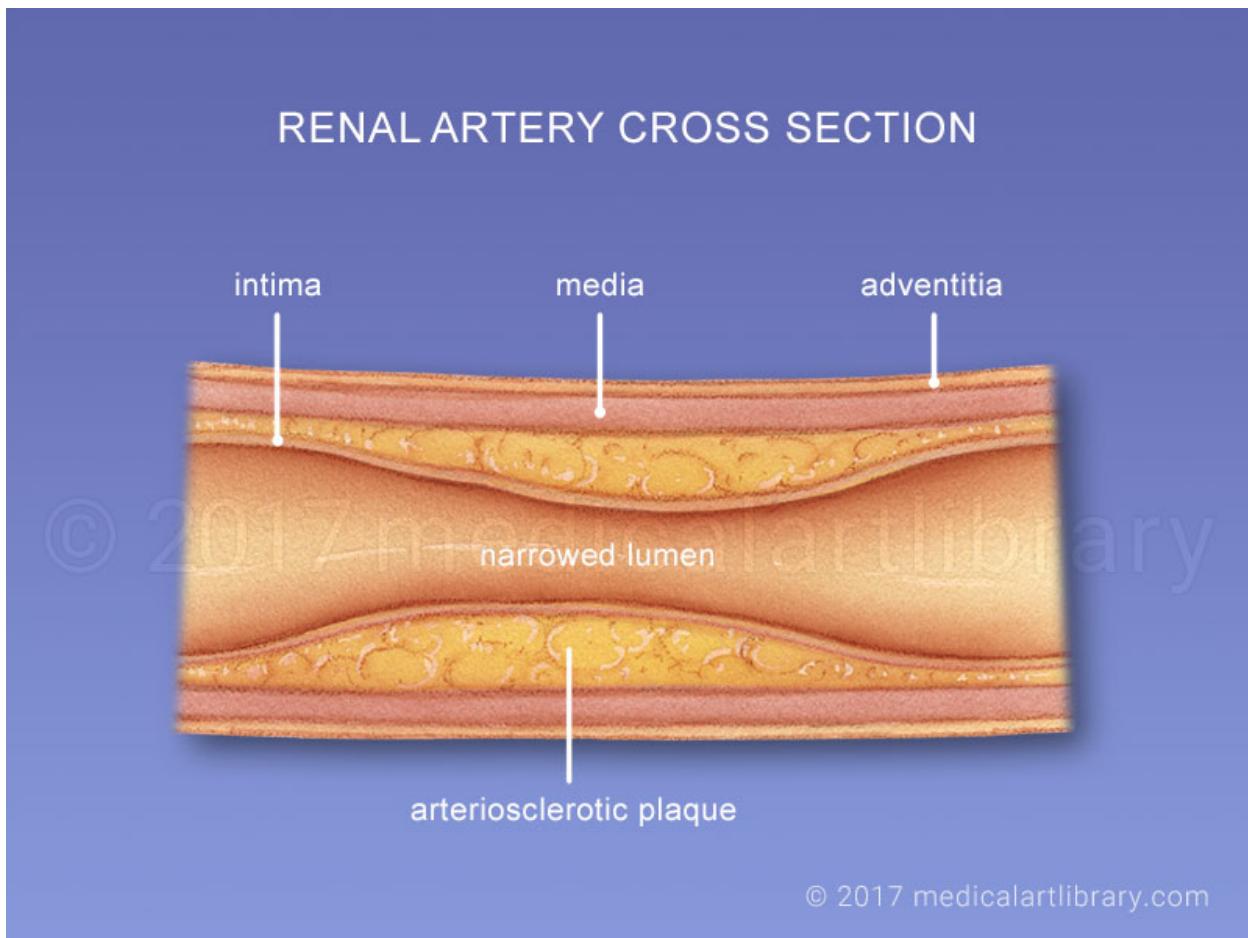

```
pd.set_option('display.max_rows', None)
mydf
```

```
plt.figure(figsize=(16,10))
xydots = [(x,y) for x,y in zip(list(-mydf["avg_logFC"]), list(-np.log10(mydf["qvalue"])))]
dotgene = list(mydf["gene"])
texts = []
seenProts = set()

for i in range(len(xydots)):
    x = xydots[i][0]
    y = xydots[i][1]

    if not dotgene[i] in seenProts and abs(y) >= 10 and abs(x) >= 0.5:
        texts.append(plt.text(x * (1 + 0.01), y * (1 + 0.01), dotgene[i], fontsize=12))
        plt.plot(x, y, 'ro')
        seenProts.add(dotgene[i])
    else:
        plt.plot(x, y, 'bo')

adjust_text(texts, force_points=0.2, force_text=0.2, expand_points=(1, 1), expand_text=(1, 1), arrowprops=dict(arrowstyle="-", color='black', lw=0.5))
plt.show()
```

In this comparison the tunica media of atherosclerotic (slided_0) and control (slided_1) aorta was compared. It must be noted, that the selected regions are considerably thicker in slided_1 compared to slided_0, but it is a known phenomenon that “The media underlying intimal athero- sclerotic plaque is considerably thinner” (Milutinović, A., Šuput, D., & Zorc-Plesković, R. (2020). Pathogenesis of atherosclerosis in the tunica intima, media, and adventitia of coronary arteries: An updated review. In Bosnian Journal of Basic Medical Sciences (Vol. 20, Issue 1, pp. 21–30). Association of Basic Medical Sciences of FBIH. <https://doi.org/10.17305/bjbms.2019.4320>).

However, due to the proximity to the background tissue (liver), for each mass it should be checked whether this mass is not also prevalent in the background tissue and therefore is present in the cluster due to diffusion, bad clustering, or other reasons. The mass_heatmap-function give a good and fast overview!

7.1.1 Tmsb4x -

First it is very interesting to see a difference in Tmsb4x between the (suspected) control and disease aortas. The diseased-aorta-media has significantly less Tmsb4x (-0.5). This is not surprising, but was already found 5 years ago (Zaima, N., Sasaki, T., Tanaka, H., Cheng, X. W., Onoue, K., Hayasaka, T., Goto-Inoue, N., Enomoto, H., Unno, N., Kuzuya, M., & Setou, M. (2011). Imaging mass spectrometry-based histopathologic examination of atherosclerotic lesions. *Atherosclerosis*, 217(2), 427–432. <https://doi.org/10.1016/j.atherosclerosis.2011.03.044>). Indeed, this can be seen as proof-of-concept.

7.1.2 Ptges3 +

On the contrary, there are other proteins, which are up-regulated in the atherosclerotic aorta. Among these is Ptges3 (+1.25), which was shown to be involved in the inflammatory response of bovine endometrial epithelial cells. Almughlliq, F. B., Koh, Y. Q., Peiris, H. N., Vaswani, K., Arachchige, B. J., Reed, S., & Mitchell, M. D. (2018). Eicosanoid pathway expression in bovine endometrial epithelial and stromal cells in response to lipopolysaccharide, interleukin 1 beta, and tumor necrosis factor alpha. *Reproductive Biology*, 18(4), 390–396. <https://doi.org/10.1016/j.repbio.2018.10.001>

Further proteins of interest include

7.1.3 Chchd4 +

Chchd4 was already identified as a biomarker for chronic obstructive pulmonary disease (COPD), a chronic inflammatory disease - in such, maybe? comparable to atherosclerosis. Chchd4 affects the mitochondrial metabolism, being named in the p53-axis controlling tumor proliferation.

Maghsoudloo, M., Azimzadeh Jamalkandi, S., Najafi, A., & Masoudi-Nejad, A. (2020). An efficient hybrid feature selection method to identify potential biomarkers in common chronic lung inflammatory diseases. *Genomics*, 112(5), 3284–3293. <https://doi.org/10.1016/j.ygeno.2020.06.010>

7.1.4 Coa6 –

The respiratory metabolism appears to play an important role in atherosclerosis. Many regulated proteins fall into this category. A Coa6 deficiency is known to be causing many disease phenotypes, including cardiomyopathy, encephalomyopathy, skeletal muscle myopathy, Leigh syndrome, metabolic acidosis and occasional hepatic failure. In summary: Coa6 deficiency does not contribute to a healthy Aorta.

Ghosh, A., Trivedi, P. P., Timbalia, S. A., Griffin, A. T., Rahn, J. J., Chan, S. S. L., & Gohil, V. M. (2014). Copper supplementation restores cytochrome c oxidase assembly defect in a mitochondrial disease model of COA6 deficiency. *Human Molecular Genetics*, 23(13), 3596–3606. <https://doi.org/10.1093/hmg/ddu069>

7.1.5 Cst3 +

Serum Cystein3 is associated with subclinical atherosclerosis, which can also be seen in the middle of the IMS aorta. It also does not seem unlikely, that Cst3 is elsewhere upregulated in atherosclerotic aorta.

Chung, Y. K., Lee, Y. J., Kim, K. W., Cho, R. K., Chung, S. M., Moon, J. S., Yoon, J. S., Won, K. C., & Lee, H. W. (2018). Serum cystatin C is associated with subclinical atherosclerosis in patients with type 2 diabetes: A retrospective study. *Diabetes and Vascular Disease Research*, 15(1), 24–30. <https://doi.org/10.1177/1479164117738156>

7.1.6 Ndufa11 +, Cox7a2 -

This protein is of interest, and together with other identified proteins (like Cox7a2), is part of the mitochondria. Atherosclerosis therefore might have an effect on the energy metabolism, similar to an ischemic stroke: James, R., Searcy, J. L., Le Bihan, T., Martin, S. F., Gliddon, C. M., Povey, J., Deighton, R. F., Kerr, L. E., McCulloch, J., & Horsburgh, K. (2012). Proteomic analysis of mitochondria in APOE transgenic mice and in response to an ischemic challenge. Journal of Cerebral Blood Flow and Metabolism, 32(1), 164–176. <https://doi.org/10.1038/jcbfm.2011.120>

7.1.7 Ndubf6 +

Ndubf6 was identified to be critical for the development of PM2.5-induced fibrosis in mouse lungs. Therefore it is likely related to inflammatory processes.

Han, X., Liu, H., Zhang, Z., Yang, W., Wu, C., Liu, X., Zhang, F., Sun, B., Zhao, Y., Jiang, G., Yang, Y. G., & Ding, W. (2020). Epitranscriptomic 5-Methylcytosine Profile in PM2.5-induced Mouse Pulmonary Fibrosis. Genomics, Proteomics and Bioinformatics, 18(1), 41–51. <https://doi.org/10.1016/j.gpb.2019.11.005>

```
_ = combSpec.mass_heatmap(pw.protein2mass.get("Tmsb4x"), scaled=True)

combSpec.mass_intensity(pw.protein2mass.get("Tmsb4x"), regions=["slided_0", "slided_1"], 
˓→scaled=True)

for gene in np.unique(mydf["gene"]):
    print(gene)
    _ = combSpec.mass_heatmap(pw.protein2mass.get(gene), scaled=True)

combSpec.mass_intensity(pw.protein2mass.get("Ptges3"), regions=["slided_0", "slided_1"], 
˓→scaled=True)
```

7.2 Another DE Analysis: whole Aorta

Having spotted several differences between the Tunica media of atherosclerotic and suspected healthy aorta, a full comparison might also be of interest.

For this, all slided_0 and slided_1 regions are compared - with the exception of the backgrounds.

```
slided_0_regions = tuple(sorted([x for x in np.unique(slided_0.segmented) if x > 0]))
slided_1_regions = tuple(sorted([x for x in np.unique(slided_1.segmented) if x > 0]))

combSpec.regions["slided_0"].plot_segments(highlight=slided_0_regions)
combSpec.regions["slided_1"].plot_segments(highlight=slided_1_regions)

resdf_all, expr, pdata = combSpec.find_markers("slided_0", slided_0_regions, "slided_1",
˓→slided_1_regions, pw, scaled=True)

combSpec.list_de_results()

mydf_all = resdf_all["ttest"][(slided_0_regions, 'slided_1', slided_1_
˓→regions)]
```

```

plt.figure(figsize=(16,10))
xydots = [(x,y) for x,y in zip(list(-mydf_all["avg_logFC"]), list(-np.log10(mydf_all[
    "qvalue"])))]
dotgene = list(mydf_all["gene"])
texts = []
seenProts = set()

for i in range(len(xydots)):
    x = xydots[i][0]
    y = xydots[i][1]

    if not dotgene[i] in seenProts and abs(y) >= 10 and abs(x) >= 0.5:
        texts.append(plt.text(x * (1 + 0.01), y * (1 + 0.01), dotgene[i], fontsize=12))
        plt.plot(x, y, 'ro')
        seenProts.add(dotgene[i])
    else:
        plt.plot(x, y, 'bo')

adjust_text(texts, force_points=0.2, force_text=0.2, expand_points=(1, 1), expand_
text=(1, 1), arrowprops=dict(arrowstyle="-", color='black', lw=0.5))
plt.show()

```

The comparison of both aorta results again in several differential proteins.

Again, several proteins involved in the respiratory metabolism are listed, like Ndufc2, Ndufa11.

Of interest here are Ifitm3, Ccdc126 and Ubl5, which are all located in the inner part of the aorta.

7.2.1 Ifitm3

Known gene involved in the innate immune system (T cells): Yáñez, D. C., Ross, S., & Crompton, T. (2020). The IFITM protein family in adaptive immunity. In Immunology (Vol. 159, Issue 4, pp. 365–372). Blackwell Publishing Ltd. <https://doi.org/10.1111/imm.13163>

Ifitm3 is involved in the plaque uptake in Alzheimer's disease: Hur, J. Y., Frost, G. R., Wu, X., Crump, C., Pan, S. J., Wong, E., Barros, M., Li, T., Nie, P., Zhai, Y., Wang, J. C., Tcw, J., Guo, L., McKenzie, A., Ming, C., Zhou, X., Wang, M., Sagi, Y., Renton, A. E., ... Li, Y. M. (2020). The innate immunity protein IFITM3 modulates -secretase in Alzheimer's disease. *Nature*, 1–6. <https://doi.org/10.1038/s41586-020-2681-2>

7.2.2 Mrps14

Mrps14 effects the mitochondrial translation. Hence, again, a disturbance of mitochondrial work can be observed.

Jackson, C. B., Huemer, M., Bolognini, R., Martin, F., Szinnai, G., Donner, B. C., Richter, U., Battersby, B. J., Nuoffer, J. M., Suomalainen, A., & Schaller, A. (2019). A variant in MRPS14 (uS14m) causes perinatal hypertrophic cardiomyopathy with neonatal lactic acidosis, growth retardation, dysmorphic features and neurological involvement. *Human Molecular Genetics*, 28(4), 639–649. <https://doi.org/10.1093/hmg/ddy374>

7.2.3 Acot13

In chicken it was observed that an Acot13 decreases works as inhibitor during Preadipocytes Differentiation. Hence, an upregulation of Acot13 leads to an increase in preadipocyte differentiation, which also plays a role in plaque formation.

```
_ = combSpec.mass_heatmap(pw.protein2mass.get("Ifitm3"), scaled=True)
_ = combSpec.mass_heatmap(pw.protein2mass.get("Mrps14"), scaled=True)
_ = combSpec.mass_heatmap(pw.protein2mass.get("Acot13"), scaled=True)

for x in set(mydf_all["gene"]):
    print(x)
    _ = combSpec.mass_heatmap(pw.protein2mass.get(x), scaled=True)

combSpec.mass_intensity(pw.protein2mass.get("Ccdc126"), regions=["slided_0", "slided_1"],
                           scaled=True)

combSpec.regions["slided_0"].plot_segments(highlight=1)

_ = combSpec.mass_heatmap(pw.protein2mass.get("Ccdc126"), scaled=True)

combSpec.mass_intensity(pw.protein2mass.get("Hsbp1"), regions=["slided_0", "slided_1"],
                           scaled=True)

_ = combSpec.mass_heatmap(pw.protein2mass.get("Hsbp1"), scaled=True)
```

7.3 The core DE

```
slided_0_inner_regions = tuple([1,3,4,6])
slided_1_inner_regions = tuple([2,3,7,8,9])

combSpec.regions["slided_0"].plot_segments(highlight=slided_0_inner_regions)
combSpec.regions["slided_1"].plot_segments(highlight=slided_1_inner_regions)

resdf_inner, expr, pdata = combSpec.find_markers("slided_0", slided_0_inner_regions,
                                                 "slided_1", slided_1_inner_regions, pw, scaled=True)

mydf_inner = resdf_inner["ttest"][(('slided_0', slided_0_inner_regions, 'slided_1',
                                     slided_1_inner_regions))]

plt.figure(figsize=(16,10))
xydots = [(x,y) for x,y in zip(list(-mydf_inner["avg_logFC"]), list(-np.log10(mydf_inner[
    "qvalue"])))]
dotgene = list(mydf_inner["gene"])
texts = []
seenProts = set()

for i in range(len(xydots)):
    x = xydots[i][0]
```

(continues on next page)

(continued from previous page)

```

y = xydots[i][1]

if not dotgene[i] in seenProts and abs(y) >= 10 and abs(x) >= 0.5:
    texts.append(plt.text(x * (1 + 0.01), y * (1 + 0.01), dotgene[i], fontsize=12))
    plt.plot(x, y, 'ro')
    seenProts.add(dotgene[i])
else:
    plt.plot(x, y, 'bo')

adjust_text(texts, force_points=0.2, force_text=0.2, expand_points=(1, 1), expand_
text=(1, 1), arrowprops=dict(arrowstyle="-", color='black', lw=0.5))
plt.show()

```

Again the same candidates as previously shown can be seen.

Mrps14, Ccdc126, Ndufa11 - which mostly relate to mitochondrial activity.

7.3.1 Timm8b

Likewise is Timm8b significantly upregulated.

Timm8b is found to be upregulated in colon mucosa carcinogenesis of diabetes type 2 patients, and is associated with mitochondrial dysfunction. A similar pattern might be observable in atherosclerosis as well.

Del Puerto-Nevado, L., Santiago-Hernandez, A., Solanes-Casado, S., Gonzalez, N., Ricote, M., Corton, M., Prieto, I., Mas, S., Sanz, A. B., Aguilera, O., Gomez-Guerrero, C., Ayuso, C., Ortiz, A., Rojo, F., Egido, J., Garcia-Foncillas, J., Minguez, P., & Alvarez-Llamas, G. (2019). Diabetes-mediated promotion of colon mucosa carcinogenesis is associated with mitochondrial dysfunction. Molecular Oncology, 13(9), 1887–1897. <https://doi.org/10.1002/1878-0261.12531>

7.4 GO analysis for plaque-DE experiment

```
